### 1.0 Introduction

On January 7, 2016, the Illinois Environmental Protection Agency's (Illinois EPA office of Site Evaluation was tasked by the United State Environmental Protection Agency (U.S. EPA) Region V to conduct a Site Inspection at the Schroud Property site in Chicago, Cook County, IL. The Schroud Property site (ILN000505540) is located on the southwest corner of Avenue O and 126<sup>th</sup> Street in Chicago, IL. The Schroud Realty Group address is also known as 12801 South Avenue O. The Latitude and Longitude for the site are 41°39'45.38"N and -087°32'36.60"W to the center of the property. The Schroud Property site is also referred to as the Schroud Realty Group, or the Shroud Site within this report.

The Site Inspection is performed under the authority of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) commonly known as Superfund. The Site Inspection is not intended to be a detailed evaluation of contamination or risk assessment. During the Site Inspection, information will be gathered regarding contaminants of concern, sources of contamination, and human and/or environmental targets.

The objective of a Site Inspection is to gather information needed to evaluate the impact that site has to human health and/or the environment. This can be accomplished by collecting and analyzing wastes and environmental media samples to determine whether hazardous substances are present at the site and determine if they are migrating to the surrounding environment. At the conclusion of the Site Inspection, a determination will be made whether the site qualifies for additional evaluation under Superfund or should be dropped from further Superfund consideration and receive a No

Further Remedial Action Planned (NFRAP) qualifier. If the evaluation of the site indicates that it qualifies for additional Superfund evaluation, an Expanded Site Inspection may be conducted. Additionally, the Site Inspection supports removal and enforcement actions and collects data to support further Superfund or other response actions.

The Site Inspection is not intended to be a detailed evaluation of contamination or risk assessment. If the evaluation of the site indicates that the site qualifies for additional Superfund evaluation, an Expanded Site Inspection may be conducted. In some cases an Expanded Site Inspection will be conducted to address critical hypotheses or assumptions that were not completely supported during the SI. The SI is performed under the authority of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) commonly known as Superfund.

A Pre-CERCLIS Screening Assessment (PCS) was completed for the Schroud Site in March 2014. The PCS was done to assess potential past activities conducted on-site as well as potential impacts to wetlands, fisheries and local residents. The Assessment recommended completion of a CERCLA Preliminary Assessment (PA) for the Schroud Site.

The PA was conducted on July 8, 2015, to collect information to support a decision to advance the site to the next level of the CERCLA process. Surface samples were evaluated during the PA using an X Ray Fluorescence (XRF) analyzer. The XRF analyzes soil for inorganic compounds. As a result of the analyses of the surficial soil samples during the PA, it was recommended that a Site Inspection (SI) be performed to

evaluate on site releases of contamination as well as impacts to the wetlands, fisheries and local populations.

Illinois EPA's Office of Site Evaluation submitted an SI work plan to U.S. EPA Region 5 on April 11, 2016. The SI health and safety plan along with directions to the nearest hospital and work plan was submitted to and approved by Illinois EPA OCS.

### 2.0 Site Background

### 2.1 Site Description

The Schroud Site is an inactive site located at 12801 South Burley Avenue, Chicago, IL; although Burley Avenue no longer extends through the site. The site is approximately 67 acres and is located on the southwest corner of 126<sup>th</sup> Street and Avenue O, Chicago, IL (Figure 7). The site was formerly used to store and dump slag material from Republic/LTV Steel. The site is located within the Illinois 2<sup>nd</sup> Congressional District and the Hyde Park Township, Section 30, Township 37 North, Range 15 East. The site is bordered on the east by wetlands and Avenue O, the west by a rail line and wetlands, the north by Indian Creek (Wolf Creek), and the south by residential homes, a rail line, and wetlands. On the east side of Avenue O is the William W. Powers State Recreation Area consisting of Wolf Lake. Multiple industrial businesses are located on the north side of 126<sup>th</sup> Street.

The Schroud Site can be accessed via a gravel road that enters from 126<sup>th</sup> Street on the northeast side of the property. The surface of the site consists mostly of slag material once produced from Republic/LTV Steel with very little vegetation. The

Republic/LTV Steel facility was located approximately one mile north on 118<sup>th</sup> Street and was adjacent to the Calumet River (Figure 8). Slag was hauled from the Republic facility to the Schroud Site; slag hauling continued once LTV Steel purchased Republic Steel in the early 1980's (Carnow, Conibear & Assoc.). In the center of the property are two large piles of waste. Dozens of smaller slag piles are located throughout the site. Slag dumping is estimated to have occurred from 1951-1977 (Carnow, Conibear & Assoc.). The larger piles of slag are approximately 30 feet in height. In addition to the piles, slag covers the ground over the majority of the site and there are no buildings located on-site. Prior investigations have indicated that there are elevated lead, manganese, and chromium levels in the soil.

Indian Creek (Wolf Creek) flows through the northern portion of the site and parallel to 126th Street. According to the National Wetlands Inventory Maps, Indian Creek is a perennial body of water that flows west-northwesterly, connecting Wolf Lake and the Calumet River and is approximately 1.25 miles in length. It flows from Wolf Lake west-northwesterly into the Calumet River. Fish and other aquatic wildlife have been documented living in the creek. Indian Creek was created to drain the wetlands located in the area so that they could be built upon. Salmon, trout and other species of fish are often found in Indian Creek. The Salmon are known to travel upstream to Wolf Lake and spawn. The Schroud Site was built on a portion of the Hyde Lake Wetlands around the 1950's. The Hyde Lake Wetlands were filled in with slag over the years. A portion of the Hyde Lake Wetlands remains today and is located around the perimeter of the Schroud Site (Figure 7).

The nearest surface water intake is located in Lake Michigan approximately three

miles to the northwest. There are no drinking water wells located in the area although there are a few Illinois State Geologic Survey (ISGS) engineering wells that are not used for drinking water purposes located within a half mile of the site. The City of Chicago has a groundwater ordinance stating that no well in the city shall be used for drinking purposes. The nearest school is located approximately a quarter of a mile to the south.

### 2.2 Site History

South Chicago has been known as a major steel production location. The property, currently known as the Schroud Site was originally part of the Hyde Lake Wetlands. According to a Preliminary Environmental Site Assessment by ENTRIX; the area was used as a steel mill slag landfill from at least 1971 to 1977. Republic Steel owned a factory along the Calumet River on 118<sup>th</sup> Street approximately ¾ of a mile to the north of the Schroud Site. Based on available records, Republic Steel transported and dumped slag waste from steelmaking, and likely other materials, at the Schroud Site (Appendix B). In 1984, Republic Steel merged with LTV Corporation to form LTV Steel, which assumed ownership of the Schroud Property and the factory to the north. LTV Steel continued its steel production at the factory on 118<sup>th</sup> Street until approximately 1996. There are no records, however, of LTV Steel using the Schroud Property as a slag dumping ground during the factory's operation in the 1980's and 1990's. After 1977, it appears both Republic and LTV Steel used landfill practices to dispose of waste (Illinois EPA).

In March 1994, Schroud Realty purchased the Schroud Site with the intention of

developing the property. A Phase I Environmental Site Assessment was conducted by ENTRIX, Inc. in 1999 as requested by the City of Chicago's Department of Environment. The assessment determined that slag was dumped by Republic Steel to a depth of approximately 20 feet. The report concluded that the owners of the Schroud Site should test and investigate subsurface soil and groundwater in order to determine the environmental impacts of the area.

During the 1990's and early 2000's, the Schroud Site was inspected numerous times by the City of Chicago for dumping and landfill violations. It was observed that in addition to slag, other construction debris including wood, clay, concrete, and bricks, were dumped on the property. The vacant nature of the Schroud Property encouraged illegal dumping throughout the years, which is prevalent to this day.

### 2.3 Previous Investigations

In 2002, the City of Chicago requested that the U.S. EPA Region 5 Emergency Response Branch evaluate the site. U.S. EPA Region 5 contracted TN & Associates to conduct a Site Assessment for the Schroud Site. During the 2002 investigation, eleven soil samples were collected throughout the property. Each sample was collected from surface to 6 inches below ground surface. The samples were analyzed for total metals and Toxicity Characteristic Leaching Procedure (TCLP) metals. Laboratory results revealed that lead, chromium and manganese were present at levels that exceeded State of Illinois benchmarks for Industrial/Construction scenarios in inhalation/ingestion routes. No removal actions were conducted as a result of this evaluation due to the limited number of samples collected over a large site and the quantity of samples

exceeding remedial objectives. More sampling was recommended to further delineate the remedial objectives.

The Illinois Department of Public Health (IDPH) reviewed the analytical data of the Schroud Site investigation conducted in 2002. The IDPH concluded that more sampling was needed to fully characterize the site and to speciate the elevated chromium samples into chromium III or chromium VI.

On June 27, 2008, an application for enrollment into Illinois EPA's Site Remediation Program (SRP) was submitted by Schroud Realty. The application requested the Illinois EPA issue a No Further Remediation (NFR) letter for the Schroud Site so the owner could begin developing the area. The site owner wanted to use the data from the 2002 U.S. EPA investigation as a basis for the NFR letter. The Illinois EPA responded that additional information was needed before a NFR letter could be issued and that the 2002 U.S. EPA investigation did not fully characterize the site. The owner of the property responded by noting that the 1999 Phase I Environmental Assessment and 2002 Site Assessment should provide the necessary information to receive an NFR. The disagreements were never resolved and the SRP review was terminated by Illinois EPA services on October 30, 2013.

In 2014, Illinois EPA conducted a Pre-CERCLIS Screening Assessment in order to determine if a Preliminary Assessment (PA) should be conducted. Due to the potential of release from air and surface water routes as well as soil exposure risk, it was recommended that a PA should be conducted for the Schroud Site.

The PA was conducted in 2015 and included the collection of XRF samples to evaluate the potential environmental risk associated with the Schroud Site. On July 8,

2015, 31 field screening sample were recorded by an Innov-X, X-Ray Fluorescence (XRF) analyzer. The XRF was used to target multiple areas of the property for the presence of heavy metals. Areas such as soil around wetlands, soil near residential properties, and several piles were tested. The data suggested that lead, manganese, and chromium were elevated compounds of particular importance. Based upon the collected information it was recommended that a Site Inspection be conducted on the Schroud Site

### 2.4 Regulatory Status

Based upon available file information, the Schroud Site does not appear to be subject to Resource Conservation and Recovery Act (RCRA) corrective action authorities. Information currently available does not indicate that the site is under the authority of the Atomic Energy Act (AEA), uranium Mine Tailings Action (UMTRCA), or the Federal Insecticide Fungicide or Rodenticide Act (FIFRA).

### 3.0 Site Inspection Activities

During the week of May 2–4, 2016 the Office of Site Evaluation (OSE) conducted a Site Inspection of the Schroud Site on the corner of 126<sup>th</sup> Street and Avenue O. OSE officials found the site was easily accessible, via a gravel road located near the northeast corner of the property, from 126<sup>th</sup> Street. There was no fencing or gate that restricted access across the access road nor were there signs indicating "No Trespassing", making the site accessible to trespassers. During the SI, there was All

Terrain Vehicles (ATV) observed on the property that generated a large amount of dust. The Site Superintendent of the nearby William W. Powers State Park stated that on a typical weekend there are approximately 20 vehicles with ATVs on trailers that trespass onto the property. Other evidence of trespassing included the presence of tree houses, beer and liquor bottles, evidence of open burning and illegal dumping of refuse and garbage.

During the SI, there were 22 samples collected for hexavalent chromium, 1 sample for semi-volatile organic compounds, and 28 samples collected for total metals, cyanide and mercury. All sampling activities were performed in accordance with Illinois EPA Standard Operating Procedures. All samples except the hexavalent chromium were analyzed by the Chemtech Consulting Group which is part of the Federal Contract Laboratory Program. Hexavalent chromium samples were analyzed by the U.S. EPA Central Regional Lab. All soil samples were collected with a stainless steel trowel and all sediment samples were collected with a stainless steel auger. All samples were then placed in glass jars and cooled in a cooler prior to shipment to the lab.

During the investigation, an X Ray Fluorescence instrument was used to screen the soil cores and attempt to target the soil intervals that may be impacted the most by past activities (Table 6).

### 3.1.1 Sediment

Indian Creek flows east to west along the northern boundary of the site. The creek drains the William W. Powers Lake into the Calumet River. During the SI there were 11 sediment samples collected and analyzed for total metals, cyanide, mercury, and

hexavalent chromium. All sediment samples were collected using a stainless steel auger and a stainless steel trowel. All samples were collected from approximately 0-12 inches into the sediment. Table 1 contains information pertaining to the sediment samples collected during the Schroud Site investigation.

### 3.1.2 Soil

There were ten soil samples collected from the Schroud Site during the SI (X101-X111). In addition, there were four residential soil samples collected (X112 – X115) and two background soil samples collected (X116-X117). The soil sample locations can be found in Figure 5 and soil sample descriptions can be found in Table 1. All soil samples collected from the Schroud Site were collected from potential source material which included the slag material that covers approximately 67 seven acres and is approximately 20 feet deep over the entire property. All samples were analyzed for total metals, cyanide, mercury, and hexavalent chromium and can be found in Table 3. Some samples were also analyzed for TCLP metals and can be found in Table 2.

### 3.2 Analytical Results

The total metals, cyanide, TCLP, and mercury samples collected during the Schroud investigation were sent to Chemtech Consulting Group located in Mountainside, NJ.

The hexavalent chromium samples were sent to the Central Regional Lab in Chicago,

IL. A complete analysis of all lab samples can be found in the Schroud Soil Workbook,

Tables 2-5.

### 3.2.1 Soil Sample Results

Table 3 summarizes the soil sample results collected during the SI of the Schroud Site. There were a total of 17 soil samples collected from 16 different locations.

Sample X109 was a duplicate of X108. The soil samples were analyzed for Hexavalent Chromium, Total Metals, Cyanide, and Mercury. One soil sample, X105, was analyzed for Semi Volatile Organic Compounds as well due to the odor of the sample. Sample X116 was used as the background sample to compare all soil samples to and to establish an observed release by documenting a release of at least 3 times the level of the background sample. There were 22 metals that were detected at or above three times background or above a removal action level. Lead, chromium and hexavalent chromium had high levels of contamination. The highest level of lead was 6850 mg/kg found in sample X103, chromium was 4400 mg/kg and hexavalent chromium was 84.9 mg/kg found in sample X111.

One sample, X105, was evaluated for semi volatile organic compounds due to a strong volatile odor encountered during the screening process. There was no detection on the screening instrument PPB Rae of any volatiles present although there was a strong odor. Analytical results also failed to detect any compounds of significance detected in the sample above any removal action level.

Residential properties are located approximately 90 feet from the slag on the south side of the site. Four soil samples were collected from four different residential properties. None of the residential soil samples detected any lead or chromium exceedances above a removal action level or observed release. Sample results from the residential properties were submitted to the IDPH for evaluation and IDPH contacted

the residents and informed them about the lab analysis. Two residential samples had exceedances of calcium and magnesium. There are no schools or daycare facilities located within 200 feet of the site.

Seven soil samples were evaluated for TCLP metals to document the toxicity of the hazardous substance found in the soil samples. Samples X108 and X109 exceeded the TCLP limit of 5 mg/L for lead. The readings were 248 mg/L and 218 mg/L respectively. The TCLP results can be found in Table 2.

### 3.2.2 Sediment Samples

Table 4 summarizes the sediment samples collected from Indian Creek which runs through the northern portion of the Schroud Site. Indian Creek was evaluated to document impact to the creek from activities that took place on the Schroud Site. There were a total of 11 sediment samples collected from nine different locations. All sediment sample depth and description can be found in Table 1. The sediment samples were analyzed for hexavalent chromium, total metals, cyanide, and mercury although not all samples were analyzed for hexavalent chromium (Table 4). There were 20 metals detected in the sediments above three times background or above a removal action level. Sample X111 was used as the background sample.

Just as the soil samples had elevated lead and chromium, the sediment samples collected from the creek and marsh area had high concentrations of lead, chromium, and hexavalent chromium as well. The highest lead sample collected from the sediment was sample X209 at 1290 mg/kg and chromium was 3540 mg/kg. Samples X209 and X210 were collected from the marsh area located along the eastern boundary

of the site. The highest lead from the creek was X203 at 860 mg/kg and chromium was 2190 mg/kg (Table 4). The highest hexavalent chromium sample from the sediment was X209 at 7.9 mg/kg which was more than three times the background (Figure 4).

### 4.0 Site Sources

This section includes descriptions of the various hazardous waste sources that have been identified at the Schroud Site. The Hazard Ranking System defines a "source" as: "Any area where a hazardous substance has been stored, disposed or placed, plus those soils that have become contaminated from migration of hazardous substance." This does not include surface water or sediments below surface water that has become contaminated.

Information obtained during the Site Inspection identified one separate site source: the slag pile as sources of contamination at the Schroud Site. Additional sources of contamination may exist.

### 4.1 Slag Pile

Slag material deposited on the Schroud Site from Republic Steels activity from 1951-1977 appears to covers approximately 67 acres and is approximately 20 feet deep throughout the site. In addition to the 20 feet deep area of slag, there are also very large piles approximately 30 feet tall, piled on top of the slag as well, measuring approximately 132,000 square feet. The approximate square footage of the piles is estimated using the Arc view measuring tool and an aerial photograph of the property

(Figure 7).

During the SI, sample X104 was drilled to 20 feet. At 20 feet fine gray sand was encountered. Prior to the slag being deposited onto the site the area was once known as the Hyde Lake Wetland. Part of this Wetlands still exists around the perimeter of the site. On the far southern portion of the slag pile there is a drop off of approximately 20 feet. Based upon all other sample locations, the depth of slag material may be uniform across the full 67-acre site. Additional sampling may be needed to fully delineate the quantity of slag material.

XRF data was also used in addition to analytical sampling to delineate the slag material throughout the site. Lead readings from the XRF collected at each sampling location ranged from below detection level to 18,382 ppm and chromium readings ranged from below detection level to 96,062 ppm (Table 6).

The slag material slopes towards Indian Creek on the northern end of the pile. The sediment in Indian Creek along the northern perimeter of the Schroud Site is white and has high concentrations of calcium. Sample X203-X206 were collected along the perimeter of the Schroud site and all had very high levels of calcium. Calcium carbonate is a common byproduct in steel slag. In addition to the high calcium levels, the pH was also high in the creek along the perimeter of the site. During the SI, there were a number of dead fish observed in the water along the northern perimeter of the site in Indian Creek. Indian Creek is known to have salmon and trout populations. The pH levels of the creek were approximately 11.5 -12 using a field based pH detector.

### 5.0 Migration Pathways

As identified in CERCLA's Hazard Ranking System, the office of Site Evaluation evaluates three migration and one exposure pathway. Sites are evaluated on their known or potential impact these pathways have on human health and the environment. The following paragraphs will evaluate the groundwater, surface water, soil exposure, and air migration pathways.

### 5.1 Groundwater

No groundwater was collected during the Site Inspection. There are a total of six monitoring wells located on the Schroud Site, but none were sampled during the SI (Figure 3). It appeared that the wells were installed some time ago and had either been compromised or were no longer in working condition due to damage. The City of Chicago utilizes drinking water from Lake Michigan and has a groundwater ordinance stating that no well in the city shall be used for drinking purposes; therefore groundwater was not collected during the SI.

The site is located in the Carmi Member and Dolton Member of the Equality

Formation. The Carmi Member is composed of silty clay deposits that accumulated in quiet-water glacial lakes. The Dolton member consists of dominantly medium grained sand with beds of silt and local lenses of sandy gravel which accumulated in shallowwater near-shore lake sediments.

The surficial geology of the area is characterized as fill material overlying unconsolidated glacial deposits consisting of quiet-water sediments, dominantly well bedded silt with interbedded clay and sand or shallow-water near-shore lake sediments, dominantly medium grained sand with beds of silty and sandy gravel. These units are

overlying clay till. The till units represent earlier stages of glacier advancement and retreat, and most likely belong to the Wadsworth Member of the Wedron Formation. A very stiff gray silty clay sand and gravel underlies the Wadsworth. The soils in this area are classified as "D2", uniform, relatively impermeable silty or clayey till at least 20 feet thick with no sand or gravel lenses, "C1", sand and gravel less than 20 feet thick over relatively impermeable till or "M", manmade land (Carnow, Conibear & Assoc.).

Bedrock, which directly underlies the till, is the Racine Formation of the Silurian Nigerian Series. The bedrock is typically composed of gray to white, medium grained, pure to slightly argillaceous, fossil ferrous dolomite. Typically, the upper portion of the dolomite bedrock is fractured, and has increased porosity and permeability. The groundwater flow for the site is to the south and south east.

Two primary aquifers are present in the Chicago region, the shallow dolomite aquifer which includes the bedrock strata directly underlying the unconsolidated glacial sediments, and the deep Cambrian-Ordovician Aquifer, which mostly consists of sandstone and is isolated from the shallow dolomite aquifer by up to 250 feet of shale. Glacial aquifers are also present in the Chicago region in the form of lacustrine sands and outwash sand and gravel.

### 5.2 Surface Water

The HRS defines the surface water pathway as the pathway that hazardous substances would travel over land from a source to surface water. The surface water pathway Target Distance Limit is 15 miles downstream from the probable point of entry from the source into the water way (Figure 6). The Probable Point of Entry (PPE) starts

at the entire perimeter of the northern boundary of the Schroud Site and continues west in Indian Creek and flows into the Calumet River. Surface water targets located downstream of the site include the Hyde Lake Wetlands and the Indian Creek fishery.

The disposal of slag material over the years on the Schroud Site has altered Indian Creek along the northern perimeter of the Schroud Site. The slag material penetrates the banks of Indian Creek. The limestone in the slag deposits contributes to high levels of carbon dioxide dissolved in the creek. When the limestone is exposed to air, the sediment in Indian Creek appears white (Verry). Analytical results showed high levels of calcium in the samples collected in Indian Creek along the Schroud property (Table 4). Samples of pH readings collected along the creek were as high as 11.5-12. During the SI, there were a number of dead fish observed in the water along the northern perimeter of the site in Indian Creek

The illegal dumping of garbage and large items such as couches and chairs on the Schroud Site has also lead to the dumping of these large items into Indian Creek; especially on the north eastern portion of the site. Also on the western portion of the site, the creek has also dammed up in certain spots due to debris in the creek. It was noted during the SI that there were couches, chairs, plastic and general refuse that had been dumped into the creek. The site is not secure and illegal dumping on site is very prevalent.

The probable point of entry (PPE) for the sediment is X207. Sediment samples collected along the frontage of the Schroud Site include sample X203 – X207. All sediment samples were compared to background sediment sample X211 as well as Removal Management Levels for industrial purposes (See Table 7). Laboratory

analysis of the sediments samples documented the migration of lead, zinc, chromium, and hexavalent chromium from the site into the creek at levels meeting the observed release criteria. In sample X203, lead exceeded the background sample by more than three times and Removal Management Levels. Otherwise, lead exceeded the background in all samples collected and ranged from 38.4 ppm to 1290 ppm.

Chromium was another contaminant of concern associated with the sediment samples. Total chromium did not have a Removal number associated with it and was only compared to the background sample X211. The chromium numbers associated with the sediment samples ranged from 5.2 ppm to 3540 ppm and the hexavalent chromium samples ranged from 4.2 ppm to 7.9 ppm.

**Table 7 Contaminants Associated With Sediment Samples** 

PPM	Arsenic	Lead	Zinc	Chromium	Hexavalent
				The state of the s	Chromium
X211					
Background	4.5	6.4	25.5	6.8	0.3
X203	5.4	860	264	2190	6.6
X204	3.0	123	57	14.4	
X205	14.3	206	309	347	
X206	2.7	316	66.9	1810	
X207	3.7	38.4	44.8	7.3	
X209	29.6	1290	6510	3540	7.9

Bold values refer to contaminants above background levels

### 5.3 Soil Exposure

The Schroud Site occupies approximately 67 acres in the Chicago, IL. Access to the site is off of 126 Street. There is neither fencing around any part of the property nor trespassing signs to inhibit access to the site. During the SI, it was noted how the property is heavily used by all-terrain vehicles for recreational purposes. Residents are located on the far southern portion of the site approximately 50 feet from the property boundary. There are no schools or day care facilities within 200 feet of the site. Wetlands are located on the western portion of the site, the Hyde Lakes Wetlands.

Table 8 Nearby population estimates within 1 mile

Distance	Population		
0-1/4	1388		
1/4-1/2	3309		
½-1 mile	4231		

Population numbers obtained from Arc View program.

All soil samples collected on the Schroud Site met the criteria for an observed release by being above three times background (Figure 5). Results which met observed release criteria are highlighted in bold in Table 3. Background and Removal Management Levels can be found in Table 3. All samples depths were collected within the top two feet except for sample X203. Sample depths can be found in Table 1.

## Contaminants associated with soil samples collected onsite\* (Table 3)

					Hexavalent		
PPM	Arsenic	Lead	Chromium	Zinc	Chromium	Magnesium	Manganese
X116			1				
Backgroun d	8	48.7	16.7	98.2	0.3	4540	325
X101	1.2	115	2790	44.1	11.2	162000	6730

<sup>\*</sup>This table does not include residential samples collected.

The slag material located on the site covers the entire 67 acres to a depth of approximately 20 feet. In addition to the slag on site, there are also two very large piles of slag disposed of on top of the slag that are approximately 30 feet tall. Electric arc furnace (EAF) dust was deposited on the Schroud Site as well. When steel is produced

using an electric arc furnace, about 15-20 kg of dust if formed per ton of steel. The dust is considered a toxic waste due to its content of heavy metals such as Zn, Pb, Cd, Mn, and Fe. The slag and EAF material were deposited by activities performed in the steel making process by Republic Steel since 1945 to 1980. Approximately 11,000,000 cubic feet of EAF were deposited over 150 acres of the Republic steel property which at one time included the 67 acre Schroud Site according to a notice of Hazardous Waste manifest (Appendix B).

Four residential soil samples were collected to determine if on site material had impacted residents that were located close to the site (Table 3). The samples collected from residential properties included X112-X115. Two of the residential samples had Mercury that was above three times background.

Seven of the soil samples collected from the Schroud Site was analyzed for Toxicity Characteristic Leaching Procedure (TCLP) metals to determine if the waste is characteristically hazardous (Table 2). The TCLP analysis was run on arsenic, barium, cadmium, chromium, lead, selenium, silver, and mercury. The TCLP analysis was not analyzed on all Schroud Property soil analysis. TCLP analysis was chosen based upon screening using the XRF and upon elevated lead or chromium readings found on the XRF readings. The TCLP limits for chromium used to establish hazardous characteristics is one part per million. There was one sample, X103, that exceeded the hazardous characteristic for chromium. The TCLP limit for lead is five parts per million and three samples exceeded this limit for lead. Sample X108 was 248 parts per million which is approximately 50 times over the hazardous characteristic limit of 5 ppm for lead. It is presumed that these elevated lead TCLP samples were collected from the

suspected EAF dumping area located on the Schroud Site.

**Table 9 TCLP Results** 

Mg/L (PPM)	X103	X108	X109
Lead	7.7	248	218
Chromium	1.4		

Bold numbers are values that exceeded TCLP limits found in Table 2.

### 5.4 Air Route

No air samples were collected from the Schroud Site during the SI and no air samples have been collected during past field investigations of the site. The site is heavily used by all-terrain vehicles that create a large quantity of dust. It was also noted that the building located across the street at the William W. Powers State Recreation Area to the east also had black dust material on the building and is believed to be from the Schroud Site. The Schroud Site lacks a vegetative cover and is entirely covered with slag material. Future air monitoring may be suggested in the future; especially if the site continues to have trespassers and large quantities of dust is generated by the all-terrain vehicles. The site is situated in a heavily residential area and nearby residents and visitors to the State Park could be exposed to the dust generated from the slag pile which does have EAF dust associated with it and is a known hazardous waste. The approximate population within the 4-mile air pathway target distance limits included in the table below.

Table 10 Population Located Around Site

Distance

### Population

O- <sub>1/4</sub>	1388		
1/4-1/2	3309		
1	4231		
2	12433		
3	66468		
4	87581		

There is a significant population that is located in the 4 mile distance from the site.

### 6.0 Additional Risk-Based Objectives

This section discusses additional risk-based objectives used to evaluate the Schroud Site. These objectives have not been used to evaluate the site for Hazard Ranking System purposes.

Sediment samples that were collected during the SI were compared to ecological benchmarks to help determine whether site activities have impacted the surface water pathway. One ecological benchmark was used for this comparison: Ontario Sediment Quality Guideline. Ontario standards are non-regulatory ecological benchmark values that serve as indictor of potential aquatic impacts. Levels of contaminants below Ontario benchmarks indicate a level of pollution that has no effect on the majority of sediment dwelling organisms. Levels of contaminants above a severe effect Ontario benchmark can cause a pronounce disturbance of the sediment dwelling community. Ontario Sediment Quality Guidelines are to be used for screening purposes and are not

to be used as regulatory, site-specific cleanup standards or remediation goals. Table 4 contains the sediment samples that exceeded the Ontario Sediment Guidelines and other benchmarks included in the table.

Soil samples were also compared to Removal Management Levels (RML) in addition to background sample X116. The RMLs are numbers used to establish if a hazardous substance exists in an extreme quantity or very high levels of toxicity. Lead was documented at levels that exceeded the RML of 800 ppm in four soil samples collected on the Schroud Site. Three of the four samples were within the top two feet. Hexavalent chromium exceeded the RML of 30 for residential in seven samples (Table 3).

### 7.0 Summary

A CERCLA Site Inspection was performed on the Schroud Site during the week of May 2-4, 2016. The SI was conducted to assess the site and determine if hazardous substance existed on the property due to past activities conducted on the site. The Preliminary Assessment field inspection was conducted on July 8, 2015. During the field inspection an XRF was used to collect approximately 30 different locations on the slag material located on site. During this screening process it was determined that enough evidence existed, such as elevated lead, chromium, and manganese to advance this site onto the SI stage. The Schroud Site was the former slag and Electric Arc Furnace Dust (Appendix B) landfill dumping grounds for Republic Steel from approximately 1945 to 1980.

Soil samples collected during the SI included lead samples of 2540 ppm and TCLP lead samples of 248 ppm. Elevated chromium samples included readings of 4400 ppm and elevated zinc readings included 1560 ppm. All of these elevated soil sample readings either exceeded the removal action level or was three times the background sample. Sediment samples also had observed release samples of lead at 860 ppm which was above three times background.

During the SI it was noted that there were a number of dead fish in the Indian Creek along the perimeter of the site. The pH along this stretch of the Indian River was as high as 11.6 according to the pH meter that was used as a screening tool. The sediment samples collected along the perimeter of the site and in the Indian Creek include samples X203 - X207.

The primary pathways of concern for the Schroud site include the surface water pathway and the soil exposure route. The slag pile covered approximately 67 acres at a depth of 20 feet in addition to the large surface piles of slag that exist on site. The adjacent Indian Creek also is impacted by slag material deposited in the creek.

Laboratory analysis of the soil and sediments samples documented the migration of lead, zinc, chromium, and hexavalent chromium from the site into the creek at levels meeting the observed release criteria.

The presence of lead, zinc, hexavalent chromium and chromium can have deleterious effects on aquatic life. Low concentrations of hexavalent chromium can have toxic effects in aquatic plants and animals. At 62 parts per billion (ppb) algae growth is inhibited and 16 ppb inhibits growth in Chinook salmon (Solomon).

The soil pathway is a concern on-site due to the volume of slag present. There are

no residents on-site; but there is heavy recreation use and trespassing on the property.

Recreational use of ATVs on the site generates large amounts of dust.

The groundwater and air pathway were not evaluated during the SI. The City of Chicago obtains drinking water from Lake Michigan. There were monitoring wells located on-site but were not sampled.

Table 1 Sample Summary Table Schroud Property Site Inspection - May 2016

Sample Number	Date/Time	Depth	Analysis	Sample Description
Sediment Sample				·
X201	5/2/2016	0-1'	TM/CN/HG	Collected from the middle of the creek on the west side of the bridge. No sheen, material looked like black and gray slag fines.
X202	5/2/2016	0-1'	TM/CN/HG	Collected from the west side of the railroad bridge. White sediment layer at 1" and grayis black material for the remainder. Slag like.
X203	5/2/2016	0-6"	TM/CN/HG/Hexavalent Chrome	Collected on south side of creek along perimeter of site. Brownish sandy; gravely material. pH 8.95
X204	5/2/2016	0-1'	TM/CN/HG	Material was white in color and fine silty texture for 2' with some clayey silt.
X205	5/2/2016	2'-3'	TM/CN/HG	Collected from same location as X204 but from 2'-3'. Fine clayey silt; gray in color with some slag.
X206	5/2/2016	0-6"	TM/CN/HG	Brown gravely sediment
X207	5/2/2016	0-6"	TM/CN/HG	black silty clay with some fine sand. pH 8.7
X209	5/4/2016	0-6"	TM/CN/HG/Hexavalent Chrome	Coffected in wetland located along east side of site in fragmities material.
X210	5/4/2016	0-6"	TM/CN/HG/Hexavalent Chrome	Duplicate of X209
X211	5/4/2016	0.6"	TM/CN/HG/Hexavalent Chrome	Collected from William T. Powers Park. Gray sandy silt.
X212	5/4/2016	0-6"	TM/CN/HG/Hexavalent Chrome	Collected from baseball park near Carondolet Ave. Material was light to dark gray sandy silt.
Soil Sample				Account of the Co.
X101	5/3/2016	1' and 13'	TM/CN/HG/Hexavalent Chrome/TCLP	Collected Hex. Chrome and TM from 1 ft in black cindery material and collected TCLP from 13ft in slag material with a reddish tint.
X102	5/3/2016	0-2'	TM/CN/HG/Hexavalent Chrome	Black slag material; small gravel like material. Collected in area of suspected electric arc furanace (EAF) dust disposal.
X103	5/3/2016	4.5'-6,5'	TM/CN/HG/Hexavalent Chrome/TCLP	Fine silty red clay material; moist. Suspected EAF dust disposal area.
X104	5/3/2016	0.5-1.5' and 6'	TM/CN/HG/Hexavalent Chrome/TCLP	Black cindery material. Collected TCLP from 6'
X105	5/3/2016	0.5'-1.5' and 8.5'	TM/CN/HG/Hexavalent Chrome/TCLP/SVOC	mottled brown gray and red material; fine slag; odor. Collected semi volatile from 8,5-9.5 ft
X106	5/3/2016	0-1.5' and 8'-9'	TM/CN/HG/Hexavalent Chrome/TCLP	gray and black cinder material; slag. Black silty clay at 8-9 ft.
X107	5/3/2016	0-1.5'	TM/CN/HG/Hexavalent Chrome	fine black cinder material
X108	5/4/2016	I-1.5' and 10.5'-12	TM/CN/HG/Hexavalent Chrome	black cindery material. Black silt with some red cinders at 10.5-12 ft. Collected TCLP from 10.5-12 ft
X109		-1.5' and 10.5'-12	TM/CN/HG/Hexavalent Chrome	black cindery material. Black silt with some red cinders at 10.5-12 ft. Duplicate of x108. Collected TCLP from 10.5-12 ft
X110	5/4/2016	0-2'	TM/CN/HG/Hexavalent Chrome	gray and black cinder material.
X111	5/4/2016	0-1.5'	TM/CN/HG/Hexavalent Chrome	black and gray cinder material
X112	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam. Residential soil sample
X113	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam with some clay and sand. Residential sample
X114	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam with some clay and sand. Residential sample
X115	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam with some clay and sand. Residential sample
X116	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam with some clay and sand. Back ground sample collected from park
X117	5/4/2016	surface	TM/CN/HG/Hexavalent Chrome	black silty loam with some clay and sand. Back ground sample collected from park

U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

UJ The analyte was analyzed for, but not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

J- The result is an estimated quantity, but the result may be biased low.

R The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sam

A Dilution Factor is 10

The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

UJ The analyte was analyzed for, but not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.

J The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

A Dilution Factor is 10
B Dilution Factor is 20

The identification of the analyte is acceptable; the reported value may be biased high. The actual value is expected to be less than the reported value.

Exceeded three times the background sample

PHOTO by: Tony Wasilewski

**COMMENTS:** X202 was collected from the west side of the railroad bridge from 1 foot into sediment. Sediment consisted of about a 1 inch white sediment layer then grayish black for the remainder of the sample.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/02/2016

TIME: 1522

PHOTO by: Tony Wasilewski

**COMMENTS:** X203 on south side of Indian Creek along the perimeter of the Schroud Property. Brownish sandy gravely material. Collected 6 inches

into sediment.

DATE: 05/02/2016

**TIME: 1522** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X203 on south side of Indian Creek along the perimeter of the Schroud Property. Brownish sandy gravely material. Collected 6 inches

into sediment.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/02/2016 TIME: 1710

PHOTO by: Tony Wasilewski

**COMMENTS:** X204 material was white in color and fine silty for the first 2 feet with some clayey silt with trace sand.

Sample collected from 0-2 feet.

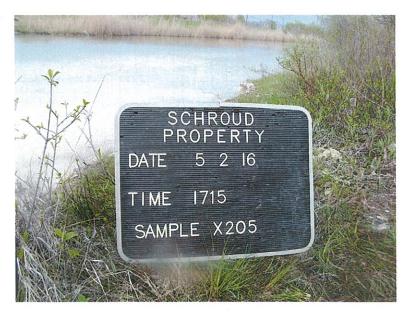

DATE: 05/02/2016

**TIME: 1715** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X205 collected from the same location as X204 but from 2-3 feet in the fine clayey silt, gray in color with some

slag material.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/02/2016 TIME: 1745

**COMMENTS:** X206 Collected at the culverts located on the Schroud Property on the East side. Collected on south side of the creek.

DATE: 05/02/2016 TIME: 1745

PHOTO by: Tony Wasilewski

**COMMENTS:** X206 Collected at the culverts located on the Schroud Property on the East side. Collected on south side

of the creek.

Schroud Property Chicago, Illinois - Cook County

DATE: 04/02/2016 TIME: 1820

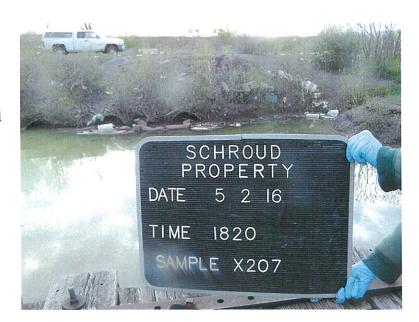

PHOTO by: Tony Wasilewski COMMENTS: X207 Collected from east side of bridge in middle of creek on east side of Schroud Property. Contained black silty clay with some fine sand.

DATE: 05/02/2016

**TIME: 1820** 

PHOTO by: Tony Wasilewski COMMENTS: X207 Collected from east side of bridge in middle of creek on east side of Schroud Property. Contained black silty clay with some fine sand.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016

**TIME: 1100** 

PHOTO by: Tony Wasilewski

**COMMENTS:** Sample X209 and X210 was collected from the wetland located on the east side of the site. Black clayey silty loam. X210 is a duplicate of X209.

DATE: 05/04/2016 TIME: 1100

PHOTO by: Tony Wasilewski

**COMMENTS:** Sample X209 and X210 was collected from the wetland located on the east side of the site. Black clayey silty loam. X210 is a duplicate of X209.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016 TIME: 1555

PHOTO by: Tony Wasilewski
COMMENTS: Samples X211 was
collected from the William T. Powers
State Park. The sample was collected as a
background sample and consisted of gray
sandy silt.

DATE: 05/04/2016 TIME: 1720

PHOTO by: Tony Wasilewski COMMENTS: Samples X212 was collected from 0-6 inches. Sample was light to gray sandy silt. Collected near

baseball field.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/03/2016

TIME: 1010

PHOTO by: Tony Wasilewski COMMENTS: Samples X101 was collected from 1 foot in the red cinder material. TCLP was collected from 13

feet from the red slag material.

DATE: 05/03/2016 TIME: 1200

PHOTO by: Tony Wasilewski COMMENTS: Sample X102 was collected from 0-2 feet. Material consisted of black slag material with

small gravel.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/03/2016 TIME: 1255

PHOTO by: Tony Wasilewski

**COMMENTS:** X103 was collected from 4.5-6 feet in fine silty red clay, moist.

DATE: 05/03/2016

**TIME: 1445** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X104 was collected from 0.5-1.5 from the black cindery material. Only Hex chrome and total metals was collected from this depth. TCLP was collected from 6 feet in black slag with larger rock like material.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/03/2016

TIME: 1615

PHOTO by: Tony Wasilewski

COMMENTS: X105 was collected from 0.5-1.5feet in a mottled brown, gray and red slag material. Hex Chrome, total metals and tclp were collected from this depth and semi volatile was collected from 8.5-9.5 feet. Depth had an odor but no reading on PID.

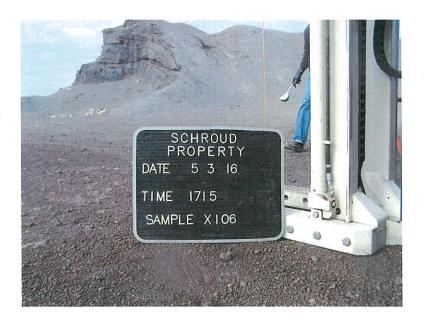

DATE: 05/03/2016

TIME: 1715

PHOTO by: Tony Wasilewski

**COMMENTS:** X106 hex chrome and total metals was collected from surface to 1.5 feet in the gray and black cinder material. TCLP was collected from 8-9

feet in the black silty clay.

**Schroud Property** Chicago, Illinois - Cook County

DATE: 05/03/2016 **TIME: 1815** 

PHOTO by: Tony Wasilewski **COMMENTS:** X107 collected hex chrome and total metals from surface to 1.5 feet. Consisted of fine black cinder

material.

DATE: 05/04/2016 **TIME: 0925** 

PHOTO by: Tony Wasilewski COMMENTS: X108 and X109 was collected from 0-1.5 for hex chrome and total metals. Material consisted of black cinders with small rocks. The TCLP was collected from 10.5-12 feet and consisted of black silt with some red material.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016

**TIME: 1020** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X110 was collected from surface to 2 feet and consisted of gray and black cinder material. Only hex chrome

and total metals was collected.

DATE: 05/04/2016 TIME: 1155

PHOTO by: Tony Wasilewski

**COMMENTS:** X111 was collected from surface to 1.5 feet. The sample consisted of black, gray and red cinder material. Only hex chrome and total metals was collected.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016

**TIME: 1230** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X112 was collected from a residential property and sampled from the surface for hex chrome and total metals. Soil was black silty loam.

DATE: 05/04/2016 TIME: 1230

PHOTO by: Tony Wasilewski

**COMMENTS:** X112 was collected from a residential property and sampled from the surface for hex chrome and total metals. Soil was black silty loam.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016

**TIME: 1240** 

PHOTO by: Tony Wasilewski

**COMMENTS:** X113 was collected from a residential property and sampled from the surface for hex chrome and total metals. Soil was black silty loam.

DATE: 05/04/2016 TIME: 1250

PHOTO by: Tony Wasilewski

**COMMENTS:** X114 was collected from a residential property and sampled from the surface for hex chrome and total metals. Soil was black silty loam with

some clay and sand.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016 TIME: 1300

PHOTO by: Tony Wasilewski
COMMENTS: X115 was collected
from a residential property and sampled
from the surface for hex chrome and total
metals. Soil was black silty loam with
some clay and sand.

DATE: 05/04/2016 TIME: 1320

PHOTO by: Tony Wasilewski COMMENTS: X116 was collected from near a ball diamond in Mann park and sampled from the surface for hex chrome and total metals. Soil was black silty loam with some clay and sand. This sample was used as a background soil sample.

Schroud Property Chicago, Illinois - Cook County

DATE: 05/04/2016

**TIME: 1325** 

PHOTO by: Tony Wasilewski

COMMENTS: X117 was collected from near a baseball diamond in Mann Park and sampled from the surface for hex chrome and total metals. Soil was black silty loam with some clay and sand. This sample was

used for the soil background.

# APPENDIX B EAF MANIFEST

#### Notification of Hazardous Waste Site SEPA

United States Environmental Protection Agency Washington DC 20460

This initial notification information is required by Section 103(c) of the Comprehensive Environmental Response, Compensation, and Usability Act of 1980 and must be mailed by June 9, 1981.

Please type or print in ink, if you need additional space, use separate sheets of hersive Environmental Response, Compensation, and Usability Act of 1980 and must be mailed by June 9, 1981.
